

Month 4 Daily Diary – React Native Learning & Basic Task Implementation

Day 1

Started learning React Native fundamentals and understood the difference between React.js and React Native. Set up the development environment, installed Node.js, Android Studio, and configured the emulator.

Day 2

Learned the basic structure of a React Native application. Explored core components such as View, Text, ScrollView, SafeAreaView, and StyleSheet.

Day 3

Worked on creating simple UI layouts using Flexbox in React Native. Practiced alignment, spacing, and responsive mobile screen layouts.

Day 4

Learned about React Native styling and implemented basic screen designs using inline styles and StyleSheet components.

Day 5

Created simple input forms using TextInput and Button components. Practiced handling user input with useState hooks.

Day 6

Learned navigation concepts in React Native using React Navigation. Implemented stack navigation between multiple screens.

Day 7

Worked on creating reusable components for buttons, headers, and cards to improve code reusability and maintainability.

Day 8

Integrated basic APIs in React Native using fetch and Axios. Displayed API response data dynamically on mobile screens.

Day 9

Learned about FlatList and implemented dynamic list rendering for displaying API-based data efficiently.

Day 10

Worked on handling loading states and conditional rendering while fetching API data in React Native applications.

Day 11

Implemented image rendering using Image components and practiced responsive image handling for mobile devices.

Day 12

Learned basic debugging techniques in React Native and fixed UI alignment and rendering issues in different screen sizes.

Day 13

Worked on simple form validation and handled button click events using React Native components and hooks.

Day 14

Explored useEffect hook in React Native and practiced lifecycle-based API calling and state updates.

Day 15

Revised React Native concepts learned during the training period and completed small practice tasks involving navigation, API integration, responsive UI design, and reusable components.
